

RNGBLOX AUTOMATION BOT

Part 1: The Full Process Step-by-Step

This is the typical flow required for RNGBLOX,

Website marks order as delivered

IF AN ORDER IS MARKED AS OVER \$200 instead direct consumers to customer service for fraud protection.

The delivery bot itself usually consists of several parts:

- **Website backend**
 - Receives orders from stripe
 - Stores the customer's Roblox username and purchased items.
 - Places the order into a queue.
- **Queue/dispatcher**
 - Picks the next available delivery account.
 - Prevents two customers from being assigned to the same bot simultaneously.
 - Allows waiting times and time estimations
 - Tracks order status (waiting, delivering, complete).
- **Bot controller**
 - Logs into a Roblox account that holds inventory.
 - Joins the appropriate game.
 - Finds the customer.
 - Uses the game's built-in trade, gift, or mailbox system to transfer the purchased item.
 - Confirms completion and reports back to the website.
- **Inventory system**
 - Tracks which bot account owns which items.
 - Moves stock between delivery accounts when needed.
 - Prevents selling items that are already reserved.
 - Adjusts and removes stock

A possible workflow to be developed could be

1. Click **Claim Now**.
2. Enter their Roblox username.
3. Add the delivery bot as a friend when required.
4. Join the bot in-game.
5. Complete the trade if the game requires it

Different Roblox games require different transfer methods:

- **Trade systems (e.g. MM2):** The bot sends a trade request and transfers the item.
- **Gift systems:** The bot sends an in-game gift for the customer to accept.
- **Mailbox systems:** The bot mails the item.
- **Join-based systems:** The bot joins the same server and completes the transfer through that game's mechanics.

Most commercial delivery bots also include quality-of-life features such as:

- Automatic friend management.
- Multiple delivery accounts running simultaneously.
- Order queues.
- Stock management.
- Retry logic if a customer is offline.
- Delivery logs and screenshots for proof.
- Automatic website status updates.

One important point: legitimate marketplaces should **not** require your Roblox password. The transfer is normally completed using the game's own trading or gifting mechanics, with only your username (and any game-specific steps like enabling trades or joining a server) required
